

Case Study :- Stairway Using The Pedestrian Barrier

Please note the 392 sloping barriers in this example are specially fabricated to a customers requirement and are not the standard 900mm barrier readily available from stock.

The above installation was carried out at a primary school, where it was felt a standard two bar handrail would offer too much of an invitation to young children to climb upon and would increase the risk of injuries from falls. These specially fabricated sloping 392 pedestrian barriers help prevent this from happening due to the vertical bar configuration. The above barriers and relevant fittings have been powder coated an additional service that is offered.
