

## Case Study :- Indoor Soft-Play Structure

**Interclamp®**  
The right connection

Interclamps are commonly used for the construction of indoor self contained play structures or as they are commonly known softplay structures. Many varied designs can be achieved using the Interclamp fittings for the frame to which foam protection strips are added to prevent injuries from occurring. Many fittings are used throughout the structure with large fittings like the 158 and 176 being ideal for multi-directional constructions like the one above.
