

## Case Study :- Riverside Pedestrian Barrier Installation

The benefits of using the 392 pedestrian panel were seen by the installer for this river wall & large drop off. The 392's vertical bars help prevent climbing that would occur with standard horizontal constructions. With no need for the 394 mesh panels which would normally need to be measured before hand, engineers were able to turn up on-site and simply bolt panels in place along the whole stretch of the wall. The 392 another versatile Interclamp product.
